

stitchgrid.

The AI production office for brands.

We start with apparel sourcing, then run the entire order as your outsourced back office.

Think of us as your production team, run by an agent. Send a photo, a description, or a sample. We turn it into a tech pack, source vetted factories, run sampling and fitting, and bring back one comparable quote at true landed cost. A signed PO in days, not nine months.

Sourcing still runs on brokers, Excel, and email.

- A brand that wants to make 2,000 hoodies spends 6 to 9 months finding, vetting, and negotiating with factories.
- The work is done by sourcing agents and brokers. It is manual, opaque, and buries a 10 to 20% margin inside the quote.
- Factories price the goods, not the journey. Freight, duties, and tariffs are an afterthought to them, but landed cost is the one number a brand can actually plan around.

It is **labor, not software**. Reading a messy brief, matching it to capable factories, and reconciling inconsistent quotes is exactly the language work AI is now good at.

Three outdated ways to find a supplier today.

01 • Back-channel agents

Who you know. Relationship-based middlemen who take 10 to 20% and answer to no one. No transparency, and it all dies if your contact does.

02 • Alibaba

A directory, not a workflow. Mostly Chinese factories, no real reviews, no milestone pricing, no help with samples, freight, payment, or QC.

03 • Trade shows

Inconsistent and expensive. A flight, a booth fee, and a few days a year to maybe meet the right factory, then back to email and hope.

And not one of them helps **after the handshake**. Samples, fittings, tech-pack revisions, freight, payment, QC: you are on your own.

WHY ME

I have lived all three of those broken channels.

Born into it

My family runs a garment manufacturing business. It is the reason we came to America in the 1980s. I grew up around factories, fabric, and production.

Built the software

Five years on the engineering team at Rent the Runway, building at the intersection of fashion, logistics, and operations at real scale.

Felt the pain

I started my own DTC brand and lived the sourcing grind: constant travel to find, vet, and chase factories, with no tooling to lean on.

I grew up **inside the factory**, and I have been the brand **chasing one across the world**. And not building alone: three sourcing agents already run supply across five countries, and an engineer is helping build the product.

The broker's whole job is language work.

Read the brief

Founders describe what they want in plain words and a photo. An agent turns it into a real, factory-ready tech pack.

Match the factory

Capability, capacity, MOQ, certifications, lead time. A ranking problem over structured factory data.

Reconcile the quotes

Messy PDFs in, one normalized comparison out, with out-of-band pricing flagged automatically.

And the demand just arrived: tariffs and supply shocks have brands urgently moving production out of China, with no one to hold their hand through it.

HOW IT WORKS · LIVE TODAY

A hoodie photo in. A signed PO out.

A brand sends us a hoodie photo. The agent writes the tech pack, sources vetted factories we have visited in person, and returns comparable quotes at true landed cost. Days later, the PO is in production. **The agent does the work a sourcing team would**, which is why this scales as software, not headcount.

MARKET

\$1.8T of apparel. A broker tax on every unit.

We don't need the whole market. We need the emerging brands diversifying production right now, and a cut of every PO they place.

\$1.8T

Global apparel market, sourced through human intermediaries today.

\$200K

Average annual production spend per emerging brand in our network.

\$14M

Illustrative revenue at 1,000 brands and a 7% take rate.

WHERE WE ARE · PHASE 0

Early, but the signal is real.

24–48h

Brief to first quote. The old way takes weeks of back-and-forth.

\$100K+

Our launch partner's first order, worth \$100K to \$150K.

10

Factories vetted and onboarded to the network.

3

Sourcing agents running supply across five countries.

Our launch partner already wants to move **more of its catalog onto StitchGrid** once this first order delivers: expansion pull before we have even shipped. One brand live, two to three more waiting for access, high-touch by design while we learn what to automate.

Land the order. Own the back office. Then move the money.

PHASE 0 • NOW

Sourcing + brokerage

Real POs through the system, run high-touch. Prove brands transact, not just browse.

PHASE 1

Back-office OS

Production runs inside StitchGrid. Cutout risk drops and the workflow gets sticky.

PHASE 2

Payments

Orchestrate milestone-linked money movement. Monetize GMV as take rate compresses.

PHASE 3

Financing

Turn workflow data into underwriting. Deposit financing and net terms for repeat brands.

PHASE 4

Attaches

QC, compliance, landed cost, supplier scorecards. More revenue per order, deeper moat.

One transaction, monetized more deeply each phase: **a 5 to 10% take rate today, payment spread and financing margin next, attach revenue throughout.** The sourcing agent is the wedge; the OS, payments, and financing are the company.

WHY THIS COMPOUNDS

Every order makes the next one smarter.

THE DATA • LIVE

Supplier scorecards: comms, delivery, quality,
landed cost

THE ENGINE

Sharper matching, pricing, and delivery-reliability
scores

THE RESULT

Better outcomes, more brands, more orders

A scorecard on every supplier **already runs in the product**: who communicates, who ships on time, whether goods arrive as expected, at what real landed cost. That proprietary record is something a horizontal AI agent cannot recreate, and it deepens with every PO.

The first order is a service. Every order after is software.

System of record

Once tech packs, POs, samples, QC, and milestones live in StitchGrid, going direct means losing the system that runs production.

Data they can't rebuild

We know each factory's real landed cost and on-time record. A brand can't recreate that by texting a factory directly.

The money rail

As payments and financing run through us, we become the rail the order settles on, not a one-time introduction.

We earn the first order high-touch, by hand. Then the agent absorbs each repeat step, so orders per person rise and gross margin expands with volume. **Operating leverage as we scale** is the proof point we are building toward next.

THE ASK

Back the agent that deletes the broker.

Apparel sourcing is the wedge. The production operating system for brands is the company. Native AI against a trillion-dollar supply chain that still runs on phone calls, with the platform shipped and the pilot live.

\$500K

Pre-seed to convert a founding engineer, hire GTM, and complete our first cohort of POs.

10 POs

The milestone that turns the pilot into a business and earns the seed round.

Platform

From sourcing today to the back-office OS, payments, and financing that compound on every order.

Founder-owned, clean cap table, minimal burn. A disciplined round where a lead check buys meaningful ownership. Valuation to discuss.
